3 **Title:** What drives job satisfaction in IT companies?  
4  
5

6 **Abstract**  
7  
8

9 **Purpose:** Strategic goal achievement in every sector of a company relies fundamentally  
10 on the firm's employees. This study aims to disclose the factors that spur employees of  
11 major Information Technology (IT) in the United States (US).  
12  
13

14 **Design/methodology/approach:** In this paper, 15.000 reviews from the top 15 United  
15 States IT companies were collected from the social media platform Glassdoor to  
16 uncover the factors that satisfy IT employees. To learn the most meaningful features  
17 that influence the scores, positive and negative remarks, as well as advice to the  
18 management team, were analyzed through a support vector machine.  
19  
20  
21  
22  
23  
24  
25  
26  
27

28 **Findings:** Results highlight a positive attitude of coworkers, contributing to a positive  
29 environment and job satisfaction. However, unsatisfied IT employees reveal that work  
30 exhaustion is the main reason for their job dissatisfaction.  
31  
32  
33  
34  
35

36 **Practical implications:** IT human resource departments can use these valuable insights  
37 to align their strategies in accordance with their employees' desires and expectations in  
38 order to thrive.  
39  
40  
41  
42  
43

44 **Originality:** The study highlights the relevance of IT companies to understand the  
45 reasons behind their employees' satisfaction. Up until now, little is known concerning  
46 the variants of job satisfaction among IT employees, enriching the understanding in this  
47 particular professional area.

## 1. Introduction

Managing human resources is a critical managerial dimension in any type of company (Zheng and Lamond, 2009). Today's competitive environment driven by new information and communication technologies leverages the relevance of keeping employees satisfied and aligned with the corporate strategy (Holland and Bardoel, 2016). Thus, human resource departments are driven by the need to fulfill employees' expectations to keep them motivated and reduce turnover (Tam and Chiu, 2010).

Both scholars and practitioners acknowledge the relevance of satisfaction factors to increase workers' productivity, helping in achieving an organization's goals (Wood and Wall, 2007). After all, employees are paramount in assisting in the building of a corporation's reputation and culture, leveraging its position in the market where it operates. Employee satisfaction is a key construct to which scholars have devoted attention within the organizational behavior scope (Zhou and George, 2001). Such a construct measures how satisfied employees are with their jobs, and it also influences turnover (Gregory, 2011). Specifically, the information technology (IT) sector is known to have high turnover rates due to the need for a very dynamic set of skills that are constantly changing, which leads to a high demand for highly skilled professionals (Thatcher et al., 2002). Thus, keeping employees satisfied is essential for talent retention in IT companies. Several factors affect employee satisfaction, including working conditions, working time, company reputation, employee relationships, salary, benefits, promotion, training, and organizational culture (Auer Antoncic and Antoncic, 2011). Therefore, companies must rigorously manage such factors to improve employee satisfaction, which leads to business success (Gregory, 2011).

Social media is a disruptive set of communication platforms built on the Web 2.0 technology with the goal of making the Internet a user-generated content media where

1  
2  
3 users express their opinions through text, images, and videos, among others (Ramos et  
4 al., 2019). There are several types of social media, including blogs, wikis, discussion  
5 forums, online review platforms, and media sharing sites. Nevertheless, the most  
6 popular are social networks (Moro et al., 2018). These come in two categories: generic-  
7 purpose (e.g., Facebook, Twitter); and specialized ones (e.g., ResearchGate).  
8 Professional social networks specifically focused on the market labor and offering a  
9 range of interesting services for connecting employers and employees have emerged,  
10 and nowadays, both companies and prospective professionals cannot afford to neglect  
11 the dissemination effect of networks such as LinkedIn and Glassdoor (Chen et al.,  
12 2017).

13  
14  
15 This study aims to unveil the factors that satisfy employees of major IT companies in  
16 the United States (US). The text written about positive and negative remarks, and advice  
17 to the management team published on the Glassdoor network is analyzed together with  
18 other features through machine learning, specifically a support vector machine (SVM),  
19 to show which are the most meaningful features that justify the granted scores. The  
20 discovered knowledge helps company managers to understand the key factors of  
21 employee satisfaction, shedding additional light on such a dynamic and vibrant labor  
22 market as is the case of the IT sector.

## 2. Background

### 2.1. IT companies in the US and their working models

The United States (US) is a relatively recent country when compared to large countries in Europe and Asia, grown from a mix of immigrants flocking into the new world to take advantage of a resource-rich and unexplored land (Gabaccia, 1999). Technology companies, especially in the Western region of the US, started to emerge and flourish in the XX century benefiting from skilled workers, some of them immigrants (e.g., Sergey

1  
2  
3 Brin, co-founder of Google), prospering from an open environment that fosters  
4 innovation (Kuz, 2010). Especially in California, and partially fueled by renowned  
5 private and public universities such as Stanford, California Institute of Technology  
6 (Caltech), and University of California, among others, “Silicon Valley” has nurtured  
7 worldwide leading companies such as Hewlett-Packard, Google, Apple, and Facebook  
8 (Adams, 2005). These mega-large companies provide important benefits, including  
9 schools for workers’ children, health units, and others only at the reach of global-scale  
10 companies (Garon, 2018). Therefore, it is not surprising that such companies make the  
11 dream job of any worker, receiving very large numbers of applications (Di Meglio,  
12 2011).

13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27 The organizational culture of companies such as Google is key for their success (Urbach  
28 and Ahlemann, 2019). Employees are encouraged to share their thoughts in an open-  
29 minded culture where communication is valued. For example, Eric Schmidt, former  
30 Google CEO adopted a transparency approach in Google’s board meetings by  
31 recognizing that he did not have a solution for the difficult problems of the previous  
32 quarter (Schmidt and Rosenberg, 2014). This initiative opened the debate to share  
33 opinions on the recognized problems. Likewise, talent retention has been at the core of  
34 Microsoft’s strategy since the 1990s. Also, by developing “a broader range of  
35 leadership talent, and implementing a career model framework”, Microsoft moved  
36 human resource strategies to the forefront (Olesen et al., 2007).

37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51 Nevertheless, the seemingly paradisiacal environment for workers in Silicon Valley  
52 overshadows well-known problems of high-performing organizations such as  
53 management bullying (Walsh et al., 2019). Additionally, as Hyde (2015) pointed out,  
54 the high-velocity labor market of the “Valley” still requires social safety nets that  
55 provide backup for employees, releasing the day-to-day pressure imposed by flexible  
56  
57  
58  
59  
60

1  
2  
3 yet not free of constraints labor in a competitive human resources market. Therefore, the  
4  
5 IT companies in the US provide an important setup needing further research.  
6  
7

## 8 2.2. *Job Satisfaction*

9

10  
11 A large body of literature has pointed to numerous factors involved in stress and  
12  
13 burnout among employees from the result of a combination of organizational stressors  
14  
15 and individual characteristics. To contradict the dissatisfaction of employees and  
16  
17 understand their behaviors, one of the most studied variables is job satisfaction (Frenkel  
18  
19 et al., 2013; Lewis et al., 2017; Zou, 2015). The definition of job satisfaction can be the  
20  
21 reaction of people who enjoy their work and do it well, revealing characteristics of  
22  
23 fulfillment and pride based on a range of elements (Castaneda and Scanlan, 2014). In  
24  
25 this scenario, there are two main stakeholders interested in this subject: managers and  
26  
27 employees. From the managers' point of view, they expect to find satisfied workers  
28  
29 that, in turn, will have a positive attitude towards the job being dedicated and  
30  
31 emotionally involved with their activity. Moreover, employees create their own  
32  
33 expectations and attitudes, expecting to be dealt with reasonably and respectfully. Thus,  
34  
35 a positive dynamic will reveal to be a key factor in accomplishing competitive  
36  
37 advantage, while a negative outcome will have a negative impact on the general  
38  
39 achievement of organizational effectiveness and performance (Melián-González, 2016).  
40  
41  
42  
43  
44  
45

46 In 2016, 13% of US IT professionals revealed dissatisfaction with their job (Statista,  
47  
48 2016), which could be the result of a variety of factors such as: (i) role ambiguity and  
49  
50 conflict; (ii) supervisory behavior; (iii) job design; (iv) compensation; (v) training and  
51  
52 development (Bakotić and Tomislav, 2013; Bowling et al., 2017; Lewis et al., 2017;  
53  
54 Zou, 2015). In order to highlight the most relevant features concerning job satisfaction,  
55  
56 each are dissected and first discussed, followed by an explanation of the data collection  
57  
58 and method of analysis used to conduct this research paper, described by the extensive  
59  
60

1  
2  
3 volume of textual data that legitimizes an automated approach. The results are then  
4  
5 discussed, followed by the conclusion and considerations for future research.  
6  
7

### 8 2.2.1. *Role ambiguity and conflict*

10  
11 The variables role ambiguity and role conflict, collectively, are referred to as role  
12 stressors. Both are predictors of employee health, job attitudes, and employee behavior  
13 (Bowling et al., 2017). Role ambiguity is associated with disorientation and confusion  
14 due to a lack of information and clarity concerning an employee's job functions, which  
15 can be translated into a stressful experience while role conflict involves conflicting or  
16 opposing expectations from coworkers that influence role performance (Madera et al.,  
17 2013). The constraints associated with role stressors occur due to difficulty of the  
18 employee in completing the job tasks that are associated with him. The conflicts and  
19 obstructions are found when employees are performing their job tasks and suffer from  
20 anxiety, work exhaustion and negative emotions (Schmidt et al., 2014; Shih et al., 2013)  
21 that in turn will have a negative impact on overall job performance and satisfaction, thus  
22 harming the company. There is a positive relationship between role conflict/ambiguity  
23 and job-related tension (Baroudi, 1985), and in US IT companies, role ambiguity and  
24 conflict have a direct impact on the employees' turnover intention (Lo, 2015).  
25

39  
40  
41  
42  
43

### 44 2.1.2. *Supervisory behavior*

46  
47 In 2016 and 2017, Canada and US IT decision-makers revealed that 71% of their teams  
48 had a lack of necessary skills to meet the companies' objectives (Statista, 2018a). This  
49 factor may lead to supervisory pressure towards their employees to perform a better job.  
50 Leadership style has an impact on the employees' job satisfaction (Mathieu et al.,  
51 2015), and when employees perceive support from their supervisor they tend to respond  
52 in the same way towards their supervisor, showing their commitment towards the  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 company's objectives, enhancing the satisfaction towards family, job, and career and  
4  
5 reducing the level of employee stress (Kang et al., 2015). On the other hand, employees  
6  
7 have reported a higher level of stress and lower job satisfaction when being monitored  
8  
9 by supervisors (Carpenter et al., 2018). Furthermore, abusive leadership has a positive  
10  
11 impact on employee turnover intention, a negative correlation with job performance,  
12  
13 satisfaction, low commitment, higher work-family conflict, and burnout. In the end, the  
14  
15 employee tends to attribute the responsibility to the company (Mathieu and Babiak,  
16  
17 2016).  
18  
19  
20  
21

### 22 2.1.3. Job Design

23  
24  
25 Job design is developed by organizations as a strategy for improving both productivity  
26  
27 and quality of work experience to reduce employee problems such as grievances and  
28  
29 absenteeism (Cullinane et al., 2013). It is related to the work specifications of contents,  
30  
31 methods, and relationships, and their outcomes are job satisfaction, engagement,  
32  
33 resilience, and thriving at work (Taylor, 2014). Hackman and Oldmans (1976) assert  
34  
35 that their job characteristics model highlights five key elements (skill variety, task  
36  
37 identity, task significance, autonomy, and work feedback) for effective performance,  
38  
39 expecting at the same time to increase job satisfaction. Nonetheless, to increase job  
40  
41 satisfaction, organizations tend to motivate employees to become job crafters, i.e., to  
42  
43 create their own job design by creating enjoyable social relationships with co-workers,  
44  
45 changing the work methods and/or specification of contents to meet the employees'  
46  
47 demands and expectations (Petrou et al., 2018). Job crafting has an impact on  
48  
49 organizational performance since the employee determines what and how the tasks are  
50  
51 completed and the interpersonal dynamics of the workplace. This impact can be positive  
52  
53 or negative, creating a challenge for organizations while avoiding negative crafting  
54  
55 (Bruning and Campion, 2018). For IT employees, job design influences morale, quality  
56  
57  
58  
59  
60

1  
2  
3 of working life, high involvement work processes, reduces employee turnover, and is  
4  
5 considered to be more important than employees' base salary (Korunka et al., 2008).  
6  
7

#### 8 *2.1.4. Compensation*

10  
11 Compensation is an organizational variable that influences job satisfaction, which in  
12  
13 turn will impact employee retention, dedication, loyalty, performance, cooperation,  
14  
15 motivation, and turnover intention, heightening the employee/organization relationship  
16  
17 (Misra et al., 2013). Employees who perceive the compensation plan as positive will  
18  
19 have a favorable view of the organizations' support (Demerouti et al., 2014). Various  
20  
21 types of compensations are employed by companies, such as pay increments or bonuses  
22  
23 (extrinsic), promotion opportunities or job security (intrinsic) in exchange for  
24  
25 employees' performance (Huang et al., 2015). The compensation plan should meet the  
26  
27 expectation of the employee by being fair and equitable. It provides tangible rewards  
28  
29 aligned with the talent and recognition. The employees' satisfaction is influenced by the  
30  
31 perceptions of their own value versus the company perception, among the coworkers  
32  
33 overall compensation plans (Williams et al., 2008). A wronged employee outcome is  
34  
35 associated with a low commitment level and turnover intention (Misra et al., 2013). In  
36  
37 the context of IT companies, compensation is used as an important factor to recruit and  
38  
39 retain skilled IT employees, and compensation tends to increase with organizational  
40  
41 tenure (Slaughter et al., 2007).  
42  
43  
44  
45  
46  
47

#### 48 *2.1.5. Training and development*

50  
51 Research shows that job satisfaction is positively associated with employees' training  
52  
53 and development (Zumrah and Boyle, 2015). Employees are an important company  
54  
55 asset and success or failure highly depends on the performance of employees.  
56  
57 Consequently, organizations are obligated to finance training and development  
58  
59  
60

1  
2  
3 programs, which in turn will strengthen knowledge, expertise, and the ability of  
4  
5 employees, thus boosting the company's competitiveness (Jehanzeb and Bashir, 2013).  
6  
7

8 Training and development involve providing the basic knowledge and skills according  
9  
10 to employees' needs to conduct their duties within company standards and growth  
11  
12 opportunities (Costen and Salazar, 2011). Employees who felt good opportunities to  
13  
14 grow within the company demonstrated a strong emotional connection to their  
15  
16 organization (Costen and Salazar, 2011). Standard organizations provide training and  
17  
18 development programs to keep their employees' highly satisfied, decrease the level of  
19  
20 employee turnover, and increase their loyalty. Young professionals with low experience  
21  
22 recognize the effort spent on their future career and perceive organization support (Sung  
23  
24 and Choi, 2014).  
25  
26  
27  
28

29 IT decision-makers worldwide highlighted that one of the main reasons for the lack of  
30  
31 skills of their teams was low investment in training programs (Statista, 2018b). IT  
32  
33 companies are constantly affected by the high degree of exposure to changes and  
34  
35 demands due to frequent changes in technology and working methods. Therefore,  
36  
37 employees are pressured to be constantly updated.  
38  
39  
40  
41

42 The current study considers job satisfaction as the general attitude towards work and  
43  
44 depends on several psychosocial factors that include role ambiguity and conflict,  
45  
46 supervisor behavior, job design features, compensation plan, and training and  
47  
48 development. Such characteristics have an impact on motivation, leading to a favorable  
49  
50 emotional state and job performance among employees, which in turn have an impact  
51  
52 on the overall performance of an IT company.  
53  
54  
55  
56  
57  
58  
59  
60

### 3. Materials and methods

This empirical study uses data collected from Glassdoor, a professional social network designed to allow professionals to rate and give feedback on their employers (Ehlers, 2015). Glassdoor offers important insights through an information rich platform to which workers can contribute using both quantitative scores and textual opinions. Luo et al. (2016) adopted a text mining approach to analyze 274k opinions of Fortune 500 companies and assess the relation between workers' opinions and companies' performance. Jung and Suh (2019) adopted a South Korean online platform similar to Glassdoor to assess job satisfaction factors using the latent Dirichlet allocation algorithm, a topic modeling technique. Thus, analyzing the information provided online on social media platforms can render interesting results from both the companies and the employees' perspectives.

We adopted the Forbes 2017 world ranking (Stoller, 2017) to select the major IT companies in the US. This ranking includes the 25 biggest technology companies worldwide in market value. From those, the 2017 edition includes 15 US-based companies, shown in gray lines in Table 1. The total dataset compiled from the Glassdoor website consists of 15 thousand reviews, 1,000 for each of the 15 companies, and 14 features highlighted in Table 2 (the US regions and divisions are detailed in Table 3).

Insert Table 1 about here

Insert Table 2 about here

1  
2  
3 Insert Table 3 about here  
4  
5  
6  
7  
8  
9

10 The approach followed is based on the studies by Silva et al. (2018) and Guerreiro and  
11 Moro (2017). It consists of building a model based on advanced machine learning  
12 techniques and extracting the hidden knowledge from it in the form of each features'  
13 relevance. In this case, the support vector machine (SVM) was chosen to train the  
14 model, since this modeling technique enables the transformation of the input features  
15 into a high m-dimensional feature space, using a nonlinear mapping. Thus, it divides the  
16 search space through the best linear separating hyperplane connected through the  
17 distributed set of support vector points (Moro et al., 2017). The data-based sensitivity  
18 analysis (DSA) was used to extract features' relevance. By varying the list of inputs  
19 through their possible range of values, it is possible to provide a reliable measure for  
20 each feature's influence, i.e., the Glassdoor granted score. Hence, we aim at explaining  
21 how each feature contributes to the granted score.  
22  
23  
24

31  
32  
33  
34  
35  
36  
37

38 The free input text where employees write about positive and negative remarks or give  
39 advice cannot be directly used as inputs to the SVM. Accordingly, we followed an  
40 approach similar to Guerreiro and Moro's (2017) study and obtained word frequency  
41 for every noun contained in each of three textual features. Verbs and adjectives were  
42 excluded since we intended to study the main items/constructs and not the intentions  
43 (verbs) or sentiments (adjectives) transmitted. Table 4 shows the words with the highest  
44 frequency for three features. Specifically, the ten most frequent words were chosen by  
45 quantifying each occurrence and also used as 30 additional features to the SVM (using  
46 the prefixes "rv.pros," "rv.cons," and "rv.advice" for each of the three original features).

#### 16 **4. Results and discussion**

17  
18

19 Before extracting knowledge from the model, it is necessary to measure its performance  
20  
21 in modeling the Glassdoor score based on the 40 input features. We adopted the k-fold  
22  
23 cross-validation [scheme](#), which provides a robust and realistic evaluation procedure  
24  
25 (Refaeilzadeh et al., 2009) by dividing the dataset into k folds of equal size and running  
26  
27 k times by using all folds for training the model except one, which is used for testing its  
28  
29 accuracy (in each run the fold for testing is rotated, assuring that every instance is used  
30  
31 for the validation procedure). K was set to 10, as recommended by Refaeilzadeh et al.  
32  
33 (2009). Two metrics were chosen [to evaluate the results](#), the mean absolute error  
34  
35 (MAE), which measures the absolute deviation between the real value and the predicted  
36  
37 [one, and the other is mean](#) absolute percentage error (MAPE), which computes a  
38  
39 percentage based on the real [value](#) in a similar computation as MAE. The obtained  
40  
41 values were: MAE=0.700; MAPE=26.85%. These are similar to what Moro, et al.  
42  
43 (2016) obtained, supporting our claim that the model is valid for proceeding with  
44  
45 knowledge extraction. [We chose](#) the 2017 top 15 US based technology companies [for](#)  
46  
47 [our study](#) (Table 1).  
48  
49  
50  
51  
52  
53

54 The analysis of Figure 1 brings interesting findings. [The](#) aggregation of the terms  
55  
56 “cons” has a relevance of 31.3%, while the “pros” terms have a relevance of 30.06%,  
57  
58 meaning that, although there is a small difference between both comments, “cons” have  
59  
60

1  
2  
3 more influence in the rating provided by the employees than “pros.” However, the  
4  
5 relevance of terms from the comment box “advice” has a greater impact on the rating  
6  
7 with a relevance of 32.29%, higher than the terms “pros” and “cons,” revealing their  
8  
9 influence in the output variable.  
10  
11  
12  
13  
14  
15

16 Insert Figure 1 about here  
17  
18  
19  
20  
21

22 The term with the highest contribution for the overall rating (cons.work) had an  
23  
24 influence of 3.99% while the lowest contributor (pros.benefit) had an influence of  
25  
26 1.81%.  
27  
28

29 The term “work” from the “cons” comment box is the most relevant feature that  
30  
31 characterizes the score granted by an IT company employee in all three comment boxes.  
32  
33 From the analysis of Figure 2, when the term “work” is mentioned six times, the rating  
34  
35 rises to 4.06. However, every time it is mentioned more than six times, the rating tends  
36  
37 to decrease until the point when it is mentioned 18 times and reaches the lowest rating  
38  
39 (3.49). Data reveals that when an employee mentions the term “work” with too much  
40  
41 emphasis, (s)he is not experiencing job satisfaction. Shih et al. (2013) reported that  
42  
43 when an IT worker is dissatisfied due to work exhaustion, this feeling is highly  
44  
45 associated to a low level of satisfaction, high level of turnover intention, lack of  
46  
47 autonomy, role ambiguity and role conflict (Shih et al., 2013). To contradict this feeling  
48  
49 of work exhaustion, human resource departments should give liberty and motivate  
50  
51 employees to redesign their own job to fit their motives, strengths, and passions by  
52  
53 changing their tasks and interactions at work. A company that provides a high degree of  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 autonomy and discretion leads to greater opportunities of job crafting influencing the  
4  
5 overall job satisfaction of the employees (Cullinane et al., 2013).  
6  
7

9

10  
11 Insert Figure 2 about here  
12  
13  
14  
15  
16

17 The term “manag” from the “advice” comment box is the second most important feature  
18 (Figure 3). The more focus on management in the advice comment box, the better is the  
19 rating. Employees who only mention the term management a few times (less than 4.5  
20 times) tend to rate the company less positively way. Advice to improve the management  
21 system reveals to be important for employees and employees feel satisfied by giving  
22 their opinions to line and senior management if the leadership style has a positive  
23 impact on employees (Mathieu et al., 2015). Supervisor behavior has an important  
24 relevance at this level since it can build a voice-supported environment that generates a  
25 positive climate for employees to feel protected, secured, and challenged to express  
26 problems and ideas (Janssen and Gao, 2015). Managers and supervisors are moderators  
27 of advice-seeking and should suggest and motivate IT employees to share opinions  
28 regarding the management style since they influence the organizational outcome, job  
29 performance, and impact over the company innovativeness (Alexiev et al., 2010).

49

50  
51 Insert Figure 3 about here  
52  
53  
54  
55

56 The third most relevant feature is the term “learn” from the positive remarks comment  
57 box (Figure 4). When the term is mentioned between 0.75 and 2 times, the rating  
58  
59  
60

1  
2  
3 increases. The best result is, in fact, when “learn” is mentioned twice. After this point,  
4  
5 the rating starts to decrease until 3.47, revealing a negative impact for the IT companies.  
6

7  
8 Previous studies suggest that, regarding training and development, employees reveal  
9  
10 propensity to acquire new knowledge, develop skills and [learn new working dynamics](#)  
11  
12 (Billett and Choy, 2013). However, since IT companies have a high degree of exposure  
13  
14 to changes and market demands, there might be a tendency to overload employees with  
15  
16 an environment of higher learning intensity, creating dissatisfaction [with](#) employees.  
17  
18 High learning intensity depends [on](#) work organization and [how responsibilities are](#)  
19  
20 [delegated](#) by managers and supervisors (Skule, 2004). The creation of a successful  
21  
22 training and development strategy [has the](#) potential to deliver positive outcomes to IT  
23  
24 companies as their success heavily depends on having their employees satisfied  
25  
26 (Jehanzeb and Bashir, 2013; Zumrah and Boyle, 2015).  
27  
28  
29  
30  
31  
32

33 Insert Figure 4 about here  
34  
35  
36  
37

38 Figure 5 highlights the terms with the most negative results in each [of the](#) three box  
39  
40 comments analyzed. [In the](#) “advice” comment box, if the term “employee” is mentioned  
41  
42 4 times, the rating will reach the lowest rating (3.05). Additionally, when the term  
43  
44 “employee” is mentioned more than 4 times, findings reveal the interest of employees to  
45  
46 share positive advice through the “advice” comment box on how to create and stimulate  
47  
48 a good relationship between coworkers. A good relationship between peers has been  
49  
50 cited as a predictor of collaboration, trust, empowerment, and responsibility among  
51  
52 colleagues (Zayas-ortiz et al., 2015). [When](#) companies motivate their employees to  
53  
54 become job crafters, there is a positive impact on the relational outcome between  
55  
56 workers (Petrou et al., 2018). [In the](#) “pros” comment box, the term that [leads](#) rating to a  
57  
58  
59  
60

1  
2  
3 lower level is “work.” When it is mentioned 5 times it decreases the rating to 3.37.  
4  
5 Nevertheless, this is the term with the highest rating. The more times it is mentioned,  
6  
7 the more inferior the rating is, showing an increasingly negative impact of the number  
8  
9 of times the term is used by IT employees. If employees give too much emphasis to the  
10  
11 term “work” in their positive comments, there is less positive satisfaction towards  
12  
13 different aspects of work, such as working conditions, working time, working  
14  
15 environment, or work-family balance. This is consistent with previous research (Anitha,  
16  
17 2014; Bakotić and Tomislav, 2013; Galea et al., 2014; Raziq and Maulabakhsh, 2015).  
18  
19 Thus, IT organizations need to create conditions in the workplace that make employees  
20  
21 motivated, satisfied, committed to strategic goals, and loyal (Misra et al., 2013). A  
22  
23 positive business environment within the organization results in a positive effect on  
24  
25 performance of employees. As expected, these data depict that the terms from the  
26  
27 “cons” comment box are those with more negative impact for the rating, followed by  
28  
29 the “advice” and “pros” terms. Companies need to be aware of the opinions placed in  
30  
31 this comment box, analyze and consider them to increase their employees’ satisfaction  
32  
33 by turning negative aspects into internal strengths.  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 Insert Figure 5 about here  
44  
45  
46  
47

48 Figure 6 uncovers the terms associated with the highest ranking. When the term “keep”  
49  
50 from the “advice” comment box is mentioned twice, the rating increases up to 4.29,  
51  
52 revealing to be the best result among the three best terms. The term from the “cons”  
53  
54 comment box that discloses the highest rating is “environ,” which after being mentioned  
55  
56 twice, raises the rating to 4.25. It is interesting to observe that the more emphasis given  
57  
58 to the term “environ,” the higher the rating is, revealing the positive impact that this  
59  
60

1  
2  
3 term has for a company's score, although it is in the "cons" comment box. Other studies  
4  
5 suggested that employees are sensitive to the overall working environment, such as job  
6  
7 design, supervisory behavior, role ambiguity and role conflict, and compensation plans  
8  
9 (Raziq and Maulabakhsh, 2015). Since the rating is continuously rising as is mentioned,  
10  
11 more advice for positive work environment leads to a better rating. Social interactions  
12  
13 and relationships are crucial for work environment and consequently job satisfaction  
14  
15 (Freney and Fellenz, 2013). The design of a reward system contributes to  
16  
17 organizational effectiveness and motivates IT employees' to work with satisfaction  
18  
19 (Misra et al., 2013). Employees satisfaction has an influence on their behavior and  
20  
21 impact on their productivity (Kim and de Dear, 2013; Raziq and Maulabakhsh, 2015).  
22  
23 From this perspective, employees give relevance and feel satisfied to contribute to a  
24  
25 better environment of the IT companies. In the "pros" comment box, the term  
26  
27 "employee" mentioned twice makes the rating increase up to 4.26, revealing that they  
28  
29 find coworkers with a positive attitude in general, meaning to be respectful, friendly in  
30  
31 terms of personal relationships, helpful, knowledgeable and resourceful colleagues (Hau  
32  
33 et al., 2013; Zayas-ortiz et al., 2015). Satisfied employees are willing to transfer  
34  
35 knowledge and skills with more enthusiasm than employees who are dissatisfied with  
36  
37 their job (Zumrah and Boyle, 2015). It is interesting to observe that the three most  
38  
39 positive terms reach their highest rating after being mentioned twice.  
40  
41  
42  
43

45  
46  
47  
48

49 Insert Figure 6 about here  
50  
51  
52  
53

54 Surprisingly, there is not a significant difference between the highest ratings of three  
55  
56 comment boxes, when it would be expected to find differences between the "pros" and  
57  
58 "cons" ratings. These results might be the consequence of emotional attachment  
59  
60

1  
2  
3 between employees and IT companies that influence the negative rating towards a nicer  
4 rating (Derks et al., 2008; Lee et al., 2013).  
5  
6  
7

## 8 **5. Conclusions**

9

10  
11 Employees are a valuable resource for an IT company to survive and thrive. An IT  
12 company needs their employees to feel satisfied to achieve the overall objectives and to  
13 remain loyal to the company in order to achieve company success (Jehanzeb and Bashir,  
14 2013). The employees' satisfaction is the premise of this commitment and dedication.  
15 Providing the necessary conditions for an employee to feel satisfied, employees can  
16 become a priceless asset. They can contribute in so many ways for a company to  
17 achieve competitive advantage in a globalized world (Bakotić and Tomislav, 2013).  
18 Employee satisfaction can help in reducing turnover, which is high in the dynamic IT  
19 sector (Thatcher et al., 2002).  
20  
21  
22

26  
27  
28  
29  
30  
31

32  
33 In this paper, 15,000 reviews were extracted from Glassdoor, a social media platform  
34 developed for professionals to rate and provide feedback about companies they work  
35 for, from the top 15 IT companies in the US, according to Forbes 2017 world ranking,  
36 using support vector machine to understand which are the most meaningful features that  
37 justify the granted scores.  
38  
39  
40  
41  
42  
43

44  
45 The achieved findings characterize the most important features that satisfy IT workers,  
46 providing IT human resource departments valuable insights to align their strategies in  
47 accordance with their employees' desires and expectations. Specifically, the results  
48 highlight that IT managers should listen to their staff's advice on their needs,  
49 management issues, and team. By also highlighting workload as negative, employees  
50 are signaling the need for further attention to improve teamwork and work balance to  
51 increase satisfaction. Hence, human resource departments can take team-building  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 initiatives to address such challenges. Regarding the positive items, learning is clearly  
4  
5 outlined, with the company's brand and environment also playing a role in employee  
6  
7 satisfaction. Thus, workers appreciate working under pivotal brands. Also, interesting to  
8  
9 note is the fact that words related to salary such as "payment" did not emerge among the  
10  
11 most relevant ones, neither in the positive nor in the negative comments. This result  
12  
13 corroborates the findings by Korunka et al. (2008), who analyzed IT employees and  
14  
15 unveiled that other factors play a more significant role to employee satisfaction when  
16  
17 compared to the base salary. This outcome is also aligned with the meta-analysis of the  
18  
19 literature study conducted by Judge et al. (2010) who found that salary is only  
20  
21 marginally related to satisfaction. Therefore, human resource departments should focus  
22  
23 more on tuning their benefits strategy instead of salaries.  
24  
25  
26  
27  
28

29 The contribution of this paper is expected to be significant. The outcome of this study  
30  
31 makes a conceptual addition to academia and management. Scholars can use this  
32  
33 valuable knowledge as an immediate reference to conduct research, considering the  
34  
35 opinion of IT employees in terms of job satisfaction while IT human resource  
36  
37 departments can redirect their strategies toward the identified characteristics that  
38  
39 enhance job satisfaction to meet the organizational objectives and mitigate less  
40  
41 satisfactory expectations, behaviors and turnover intentions of actual and future  
42  
43 employees. This paper can help IT human resource departments to understand the  
44  
45 wishes of employees and take advantage of various actions highlighted that can be taken  
46  
47 to prevent negative outcomes. The work of a satisfied employee can benefit both  
48  
49 employees and IT companies.  
50  
51  
52  
53

54  
55 Despite the insights and contributions of this paper, there are limitations that need to be  
56  
57 addressed and considered for future research. The collected data refers to the general  
58  
59 employees of the 15 most important American IT companies, and not to specific  
60

1  
2  
3 departments of those companies. Therefore, in future research, data should be separated  
4  
5 by departments to perceive the most meaningful variables of job satisfaction of each IT  
6  
7 company department. It would be interesting to understand the reasons that make top  
8  
9 managers satisfied with their position at an IT company and which factors have the  
10  
11 most relevance to their satisfaction.

Table 1 - Features used for the analysis

Feature	Description
rv.month	Month when the review was written
rv.weekday	Weekday when the review was written
rv.is.weekend	If the review was written on weekend
rv.user.status	Current or former employee
rv.user.function	Management, technical, or other
rv.user.division	User's US division located, or from abroad
rv.user.region	User's US region located, or from abroad
rv.user.outlook	User recommendation rate, outlook, and CEO approval, one from 3 categories: Green, Orange, Red
rv.CEO.approval	
rv.user.years	Years in the company: $\leq 3$ years; $> 3$ years
rv.pros.text	Free text with positive remarks, negative remarks, and advice to management
rv.cons.text	
rv.advice.text	
rv.score	Review score

Table 1 - US regions and divisions

Region	Division	States
Northeast	New England	Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont
	Mid-Atlantic	New Jersey, New York, Pennsylvania
Midwest	East North Central	Illinois, Indiana, Michigan, Ohio, Wisconsin
	West North Central	Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota
South	South Atlantic	Delaware, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, District of Columbia, West Virginia
	East South Central	Alabama, Kentucky, Mississippi, Tennessee
	West South Central	Arkansas, Louisiana, Oklahoma, Texas
West	Mountain	Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming
	Pacific	Alaska, California, Hawaii, Oregon, Washington
